# 2005 Cost of Capital Study of the Interstate Natural Gas Pipeline Industry for the

# Interstate Natural Gas Pipeline Property Tax Forum January 1, 2005

# Purpose of the Cost of Capital Study

The purpose of the cost of capital study is to provide the Interstate Natural Gas Pipeline Property Tax Forum (INGPPTF) with a cost of capital study for the Interstate Natural Gas Pipeline Industry (INGPI) as of January 1, 2005. This cost of capital can be used to capitalize the net cash flow for the typical interstate natural gas pipeline company for the purpose of estimating market value. The cost of capital derived in this study is the cost of capital for the typical interstate natural gas pipeline company at January 1, 2005, and is not representative of any particular interstate pipeline company. Thus, we advise against its random use by anyone without first examining and determining the differences between the specific pipeline company and the typical pipeline represented by the cost of capital herein and adjusting for the differences accordingly. For example, if one were interested in the typical cost of capital for a mid-cap or a low-cap pipeline, size adjustments of 0.95% and 1.81% respectively would need to be made.¹ Further, for companies which are considered below investment grade, additional adjustments must be made to reflect the enhanced risk associated with an investment in the operating assets of such companies. (Currently the typical interstate natural gas pipeline company's long-term debt is rated only one level above junk bond status.)

# **Introduction and Scope**

This copyrighted study was prepared for the Interstate Natural Gas Pipeline Property Tax Forum and any use of this material by any entity other than those approved by the INGPPTF is expressively prohibited by the author, who reserves all rights to any reproduction. In this study we have reviewed financial and economic information, analytical reports, and statistics in order to estimate the cost of capital of the Interstate Natural Gas Pipeline Industry as of January 1, 2005.

<sup>&</sup>lt;sup>1</sup> Risk Premia over Time Report: 2005, (Chicago: Ibbotson Associates, 2005), p. 6

# **Executive Summary - Cost of Capital**

Based on our analysis and investigation, we have calculated the rounded weighted average cost of capital (WACC) for the INGPI to be 10.40% as of January 1, 2005. The cost of capital developed in this study is appropriate to use in discounting the after-tax operating cash flows projected as of January 1, 2005 for determination of the market value of the operating assets, tangible and intangible, of the INGPI. After-tax operating cash flows are known as earnings before the deduction of interest, depreciation and amortization and after the deduction of taxes and capital expenditures. For market valuation purposes, this level of cash flow is estimated typically by assuming that depreciation and amortization equals capital expenditures. Thus, the cash flow to be discounted is assumed to be equal to what is commonly known in the INGPI as net utility operating income (NUOI). The detailed discussion of the derivation of the weighted average cost of capital along with supporting documentation begins on page 9.

### **General Economic Data - 2005**

During 2004, the U.S. economy moved forward on its continued recovery from the prior year. Accommodating conditions and expansion stemmed mostly from Federal Reserve policy. The tag line in the old Timex commercial also applies to the U.S. latest three-year economic expansion: It takes a licking and keeps on ticking. Despite terrorist attacks, corporate scandals, war in Iraq, and soaring oil prices, the U.S. economy kept performing, and growth accelerated

each year since the 2001 recession.<sup>2</sup>

The outlook for the U.S. economy in 2005 is promising. Low overall inflation and continued improvement in the job market will provide the base for solid economic growth next year, according to the fourth quarter 2004 *EconSouth* published by the Federal Reserve Bank of Atlanta. The U.S. economy is expected to continue to grow at a solid pace in 2005 and be a major contributor to global growth, according to private and government economists. The three major indicators of economic performance – GDP [Gross Domestic Product], inflation and the unemployment rate typically provide economic forecasters a basis for future economic projections.

The Bush administration forecast issued December 17, 2004 reported that the U.S. gross domestic product would grow at a real, inflation-adjusted rate of 3.5 percent next year. Growth is expected to dip slightly in 2006 to 3.4 percent. Meanwhile, inflation is projected to remain steady at about 2 percent as oil prices decline and unemployment is expected to fall from its current 5.4 percent to 5.1 percent in 2005.<sup>3</sup>

The Philadelphia Federal Reserve Bank's (PFRB) forecast agreed with the Bush administration's forecast with the exception of a growth forecast of 3.8 percent in the first half of 2005, 0.3 percent higher than Bush administration's projection. Additionally, the PFRB projected inflation easing to 2.4 percent in 2005 from a forecast average of 2.7 percent in 2004, again slightly higher than the Bush administration's forecast.<sup>4</sup>

Private forecasts for U.S. economic growth in 2005 range from 3.0 to 4.5 percent, a slight dampening from the growth of 3.5 to 4.5 percent in 2004. Strong growth in 2004 was driven by business investment, which more than compensated for a more recent slowdown in consumer spending according to Andrzej Zwaniecki, Washington file staff writer with the US Government Information office.

Wall Street gazed into its crystal ball for 2005 and liked what it saw -- sort of. The Wall Street Journal's Scott Patterson spoke with 10 strategists to find out how they thought financial markets would perform in 2005. While the general consensus was positive for stocks in 2005, the strategists saw several clouds lurking. Skyrocketing U.S. budget and trade deficits, tepid job

<sup>&</sup>lt;sup>2</sup> Madigan, Kathleen and James C. Cooper. "Financial Fuel for the Economy's Engine," *BusinessWeek*, January 10, 2005, 29.

<sup>&</sup>lt;sup>3</sup> "Strong U.S. Economic Growth Forecast by Bush Advisers," http://uninfo.state.gov/usinfo/Archive/2004/Dec/17-226915.html.

<sup>&</sup>lt;sup>4</sup> Reuters, "US Economy Seen Easing in 2005 - Fed Poll," http://biz.yahoo.com/rb/041221 /economy\_fed\_livingston\_1.html.

growth and weakening corporate profits were all current trends that could hurt the economy and stocks. The biggest fear of all, the strategist found, was of inflation. The Federal Reserve raised its target on the federal-funds rate five times in 2004 to 2.25% in order to keep a clamp on inflation.<sup>5</sup>

The consensus outlook of 56 economists surveyed by *The Wall Street Journal (WSJ)* was that the gross domestic product -- the broadest measure of economic activity -- will expand at a rate of about 3.6% in 2005. That pace would be a tad slower than 2004's, which was 3.9% through the first nine months of the year. The consensus forecast calls for the U.S. unemployment rate, which as 5.4% in November 2004, to edge down to 5.1% by the same month in 2005. The call for modest but healthy U.S. growth in 2005 is based on a number of important assumptions. Most notably, economists expect oil prices to stabilize or even decline after running as high as \$55 a barrel in 2004. That development, the *WSJ* forecasters surveyed say, should help restrain price inflation and bolster the purchasing power of households that lost out to high gasoline and home-heating costs in 2004.<sup>6</sup>

### **Summary**

The U.S. economy will perform well in 2005, according to a survey of both private and government economists' predictions, with modest but healthy growth, subdued inflation and only slight rises in interest rates. But there are challenges ahead as well. Many of the forecasters surveyed worry about the low household-saving rate and wide budget and trade deficits. While a few of the economists believe these problems could create trouble in 2005, the majority sees these as long-term problems that won't derail the expansion anytime soon. Overall, both private and government economists project the GDP to be between 3.0 and 4.5 percent, inflation ranging from 2.0 to 2.4 percent and unemployment at 5.1%.

### 2005 Economic Outlook - Natural Gas Pipeline Industry

*BusinessWeek*, in its Annual Industry Outlook reported that in 2004, oil and natural gas prices neared or hit record highs. Refiners, running almost flat out to meet demand, posted lush profits. But market forecasters anticipate softer oil prices and flat gas prices this year, thanks to

 $<sup>^{\</sup>rm 5}$  Patterson, Scott, "Wall Street's Crystal Ball Reveals an Overcast 2005," The Wall Street Journal Online, January 2, 2005.

<sup>&</sup>lt;sup>6</sup> Ford, Constance Mitchell and Jon E. Hilsenrath. "U.S. Economy Expected to Perform Well in 2005," *The Wall Street Journal online*, January 3, 2005. http://online.wsj.com/article\_print/0,,SB110451275000514206,00.html.

<sup>&</sup>lt;sup>7</sup> Ibid.

slowing economic growth, increased capacity, and more conservation efforts by manufacturers and consumers. Looking at a broader group, Thomson First Call predicts that profits for the 277 energy companies in the *Standard & Poor's* 500-stock index will fall 5% in 2005, after a 47% climb in 2004.<sup>8</sup>

The risk that prices will rise and be volatile is greater for natural gas. North American production can't match demand growth. The U.S. Energy Information Administration predicts natural gas demand will grow by 3.7 percent in 2005, especially due to rising demand for gasfired electricity generation. Yet domestic gas output will grow by only 1.9%. That gap makes for rising prices. Craig Pennington, global energy group director at Schroders, expects U.S. natural gas prices to climb to an average of \$6.45 per thousand cubic feet in 2005, from \$6.00 last year.<sup>9</sup>

# **Key Energy Issues to 2025**

The North American natural gas industry is facing a critical period over the next 10 to 15 years, according to Energy and Environmental Analysis, Inc. in its paper prepared for the INGAA Foundation, July 2004. Since 2000, the balance between natural gas supply and demand has tightened substantially. A number of important events have occurred recently in the natural gas markets contributing to the tightening including:

- A decline of excess natural gas productive capacity or elimination of the "gas bubble";
- The construction of over 200 GWs of gas-fired generation since 1999 with limited amounts of alternative fuel capability (oil backup); and
- A rebound in the U.S. economy in 2003 after negative and slow growth in 2001 and 2002.

The root of the natural gas problem is that production in North America has hit a plateau and can no longer keep up with growing demand in the U.S. and Canada. As a result, the U.S. is facing a future with higher natural gas prices and a growing dependence on overseas imports of liquefied natural gas (LNG) for incremental supply. In December 2004, the Senate Energy and Natural Resources Committee, Chaired by Senator Domenici, requested "fresh ideas" to address the growing natural gas crisis in the U.S.<sup>10</sup>

<sup>&</sup>lt;sup>8</sup> Zellner, Wendy, Christopher Palmeri & John Carey, "Energy - No Gusher, But a Steady Flow," *BusinessWeek*, January 10, 2005, 93-94.

 2005 INGPI Cost of Capital - Page 5

The Department of Energy's *Annual Energy Outlook 2005* projects that the prices of most energy sources are expected to decline until 2010 and then begin a slow increase ending up just under or about even with 2004's prices by 2025. The average wellhead prices are projected to decrease from \$4.98 per thousand cubic feet in 2003 to \$3.64 per thousand cubic feet in 2010 as the initial availability of new import sources and increased drilling expands available supply. Also, the U.S. can anticipate an increasing reliance on energy imports. Most of the additional supply is expected to come from Alaska and imports of LNG. Net imports are expected to meet a growing share of U.S. energy demand, constituting 38 percent of total energy consumption by 2025 (up from 27 percent in 2003).

A key issue is whether the investments and regulatory approvals needed to make those natural gas supplies available will be forthcoming and what the effects will be if they are not. By 2025, natural gas wellhead prices will rise again to \$4.79 per thousand cubic feet according to the Annual Energy Outlook 2005.

### Alaska Natural Gas Pipeline

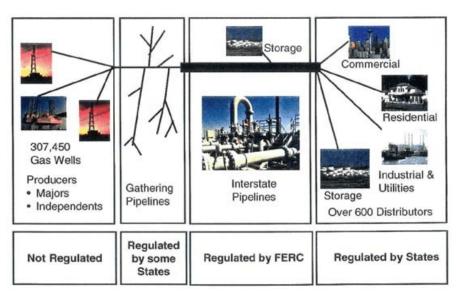

In 2004, legislation was enacted to support construction of the Alaskan Gas Pipeline. The Alaska Gas Pipeline is expected to cover 3,500 miles and be completed around 2015. When completed, it is expected to deliver 1.5 TCF per year of natural gas from Alaska, which one study

estimated would reduce natural gas costs by about \$0.50/mm Btu. Pipeline construction is expected to cost approximately \$20 billion.<sup>11</sup>

### **Regulatory Environment**

For the past 15 years, federal and state regulators have enacted policies to enhance competition in the natural gas industry. The chart to the right is from the

# The Natural Gas Industry

2005, 1.

<sup>&</sup>lt;sup>11</sup> *Ibid*, 6.

Interstate Natural Gas Association of America (http://www.ingaa.org/images/mainindustryregulations\_map.jpg) and provides a breakdown of state and federal regulation.

Initially, the Federal Energy Regulatory Commission (FERC) altered the ground rules by which the interstate natural gas pipelines did business with FERC Order 636. [On April 8, 1992, the FERC issued Order 636 which brought about additional fundamental changes in the way natural gas pipelines conduct their businesses. The FERC's stated purpose of FERC Order 636 was to improve the competitive structure of the natural gas pipeline industry by, among other things, unbundling a pipeline's merchant role from its transportation services; ensuring "equality" of transportation services; ensuring that shippers and customers have equal access to all sources of gas; providing "no-notice" firm transportation services that are equal in quality to bundled sales service; and changing rate design methodology from modified fixed variable to straight fixed variable.] As a result of FERC Order 636 and the snails pace at which deregulation in the interstate natural gas pipeline industry has progressed, the long-haul gas systems were provided powerful economic inducements to find merger partners to aid in the scurry for market share. This resulted in the fusion of the pipelines in the late 1980s and early 1990s. FERC Order 636 guidelines called for the pipelines to abandon their traditional calling as resellers, flowing dedicated gas volumes to utility systems, to venture into their new discipline as gas transporters for all comers (common carriers).

In FERC Order No. 637, the Commission amended its regulations in response to the growing development of more competitive markets for natural gas and the transportation of natural gas. In the rule, the Commission revised its current regulatory framework to improve the efficiency of the market and provide captive customers with the opportunity to reduce their cost of holding long-term pipeline capacity while continuing to protect against the exercise of market power. The rule revised Commission pricing policy to enhance the efficiency of the market by waiving price ceilings for short-term released capacity for a two-year period and permitting pipelines to file for peak/off-peak and term differentiated rate structures.

## **Factors Applicable to the Appraisal of Interstate Pipelines**

Interstate pipelines have both utility and merchant characteristics. They are similar to monopoly utilities in that they require significant capital expenditures, involve a permitting process, and are subject to price controls. However, an interstate pipeline's service territory can be expanded through new permitting and construction. It is also subject to competition from other pipelines that are built close enough to compete for institutional customers. Pipelines also differ from local distribution companies (LDCs) in that their business generally relies on a limited number of large institutional customers. This customer concentration increases risks associated with bad debt expense. When evaluating a pipeline company, appraisers investigate

demand and supply growth along a pipeline's footprint, opportunities for pipeline expansion, applications for competitive pipeline developments, and the growth prospects and credit quality of shippers along the pipeline's system.

Pipeline capacity utilization is affected by the location of natural gas supply sources and shifts in consumption patterns. A change in source requires new pipelines to transmit gas from growing production centers. The increasing use of LNG imports to coastal ports affects the need for and utilization of pipeline assets.

The demand side of the equation is also subject to potential secular shifts. For example, growth in the number of gas-fired electric generating plants has had a major impact on geographical demand patterns. The appraiser must be aware of longer-term supply and demand trends that could increase or decrease the value of pipeline assets.

Many pipeline companies have historically engaged in various energy merchant activities through subsidiary operations. Thus the appraiser must be careful not to assume that a company has a low risk profile just because it owns substantial regulated pipeline assets.

A number of pure-play businesses are owned by master limited partnerships (MLPs). MLPs trade on exchanges just like common stocks, but the businesses avoid income taxation by paying out nearly all free cash flows to shareholders. These income-oriented investments generally trade based on their yield, distribution growth potential, and volatility of cash flows.

Because MLPs cannot utilize operating cash flows for growth oriented capital expenditures, they are dependent on the ability to continuously raise fresh debt and equity capital to fund new investment. The general partners (GPs) for MLPs often have performance participation awards that provide the GP with larger and larger interests in MLP distributions as the dividend is raised. An appraiser may need to evaluate an MLP's capacity to raise distributions in light of growth opportunities, access to capital markets, and GP performance participation award. All of the political and economic factors discussed in this section will affect the typical investor's cost of capital as the elements of business risk increases. The additional risk attributable to the natural gas pipeline industry should be reflected in the development of the cost of capital.

Shere, Craig. Industry Surveys: Natural Gas. Standard & Poors, May 13, 2004, 32.

 2005 INGPI Cost of Capital - Page 8

# Weighted Average Cost of Capital (WACC)

The return investors require on investments of comparable risk is what the cost of capital measures. Rational investors will not invest in a particular investment opportunity if the expected return on that opportunity is less than their cost of capital requirement. The weighted average cost of capital (WACC) is also known in the appraisal and financial community as the opportunity cost of capital. The WACC is used primarily for making long-term capital investment decisions by investors and purchasers. Accordingly, the WACC is used by appraisers to estimate *market value*. <sup>13</sup> To calculate market value, the appraiser discounts expected future income (cash flow) by the rate of return offered by comparable investment alternatives. [All of the annual "income" figures used in appraising income-producing properties are *cash flows* rather than accrual accounting incomes. <sup>14</sup>] This rate of return is often referred to as the discount rate or the opportunity cost of capital. <sup>15</sup> The Appraisal Institute has defined opportunity cost as quoted below:

Opportunity cost is the net cost of opportunities not chosen or options foregone, denied or lost. An investor who selects one investment forgoes the opportunity to invest in other available investments...Opportunity cost is related to the principle of substitution, and is particularly significant in estimating the rates of return necessary to attract capital. By analyzing and comparing the prospective rates of return offered by alternative investment opportunities, an appraiser can estimate the required rate of return for the property being appraised.<sup>16</sup>

The estimated cost of capital in this report for the Interstate Natural Gas Pipeline Industry as of January 1, 2005 is based on the generally accepted appraisal methodology known as the band of investment technique. The band of investment technique consists of the following steps:

<sup>&</sup>lt;sup>13</sup> Market value is defined by the Appraisal Institute as, "The most probable price, as of a specified date, in cash, or in terms equivalent to cash, or in other precisely revealed terms, for which the specified property rights should sell after reasonable exposure in a competitive market under all conditions requisite to fair sale, with the buyer and seller each acting prudently, knowledgeably, and for self-interest, and assuming that neither is under undue duress." See *The Appraisal of Real Estate*, 12<sup>th</sup> ed., (Chicago: Appraisal Institute, 2001), 22.

<sup>&</sup>lt;sup>14</sup> William N. Kinnard, Jr., *Income Property Valuation*, (Lexington: Heath Lexington Books, 1982), 70.

<sup>&</sup>lt;sup>15</sup> Richard A. Brealey and Stewart C. Meyers, *Principles of Corporate Finance*, 4<sup>th</sup> ed., (New York: McGraw-Hill, 1991), 13.

 <sup>16</sup> The Appraisal of Real Estate, 11<sup>th</sup> ed., (Chicago: Appraisal Institute, 1996), 44.
 Copyright © 2005 Tegarden & Associates, Inc. All rights reserved.
 2005 INGPI Cost of Capital - Page 9

- 1. Analyze and determine the appropriate capital structure.
- 2. Identify the appropriate cost for each financing band of the capital structure.
- 3. Weight the appropriate cost for each financing band by the relative proportion of the capital structure represented by each financing band.

The sum of the weighted costs for the financing bands represents the weighted average cost of capital. This weighted cost of capital is typically known as the discount rate in appraisal literature and the algebraic formula is shown in Figure 1.

In explaining the estimation of the cost of capital, Ibbotson Associates states:

$$K = (D \times D_r) + (E \times E_r)$$

where

K = Weighted Average Cost of Capital

D = Proportion of Debt in Capital Structure

 $D_r = Cost \ of \ Debt$ 

E = Proportion of Equity in Capital Structure

 $E_{\star} = Cost \ of \ Equity$ 

Figure 1

The cost of capital is always an expectational or forward-looking concept. While the past performance of an investment and other historical information can be good guides and are often used to estimate the required rate of return on capital, the expectations of future events are the only factors that actually determine the cost of capital. An investor contributes capital to a firm with the expectation that the business' future performance will provide a fair return on the investment. If past performance were the criterion most important to investors, no one would invest in start-up ventures. It should also be noted that the cost of capital is a function of the investment, not the investor.<sup>17</sup>

# **Cost of Capital Study Results**

The cost of capital for the Interstate Natural Gas Pipeline Industry as of January 1, 2005 is estimated to be **10.40%** as the following chart indicates. Following the chart are explanations of the derivation of each of the component parts.

<sup>&</sup>lt;sup>17</sup> SBBI (Stocks, Bonds, Bills and Inflation), 2004 Yearbook: Valuation Edition, (Chicago: Ibbotson Associates, 2004), 23.

Capital	Portion	Cost	Product
Debt	25.00%	6.19%	1.55%
Equity	75.00%	11.80%	8.85%
Totals	100.00%		10.40%

# **Capital Structure**

Economists and appraisers measure a firm's capital structure in terms of the market values of its debt and equity because that is the best measure of the amounts of debt and equity that investors have invested in the company on a going-forward basis. Furthermore, economists and appraisers generally agree that the goal of management is to maximize the value of the firm, where the value of the firm is the sum of the market value of the firm's debt and equity. Only by measuring a firm's capital structure in terms of market values can its managers choose a financing strategy that maximizes the value of the firm.

For estimating the cost of capital for the INGPI, it is appropriate to use the typical market capital structure for similar interstate natural gas pipeline companies. There is very little debate about this concept, however for clarity we note the following statement from Brigham and Gapenski.

We are absolutely convinced that the procedures we recommend are correct—namely, firms should focus on market value capital structures and base their cost of capital calculations on market value weights. Because market values do change, it would be impossible to keep the actual capital structure on target at all times, but this fact in no way detracts from the validity of market value targets.<sup>18</sup>

In the appraisal process or in developing the cost of capital to be used in the appraisal process the appraiser must utilize the market capital structure for all types of appraisal. Even when public utilities are strictly regulated, it is necessary for the appraiser to use the market capital structure unless the book capital structure is found to be the same as the market capital structure. In the past often the book capital structure was quite similar to the market capital structure, however that is not the case today. Today the market capital structure varies significantly from the book capital structure for most interstate natural gas pipelines. Thus, investors are concerned with the capital structure they will use to finance the purchase of an interstate natural gas pipeline and that will always be the typical market capital structure.

<sup>&</sup>lt;sup>18</sup> Eugene F. Brigham and Louis C. Gapenski, *Financial Management*, 7<sup>th</sup> ed. (New York: The Dryden Press, 1994), 599.

It is also important to note what elements of capital comprise the makeup of the *capital structure* from an appraisal standpoint. The capital structure consists only of long-term debt, common stock, and where appropriate, preferred stock. The capital structure should not be confused with *financial structure* or any other term used in financial literature. To understand what elements comprise the capital structure it is important to define capital structure and financial structure, which are defined as follows:

**CAPITAL STRUCTURE** corporation's financial framework, including LONG-TERM DEBT, PREFERRED STOCK, and NET WORTH. It is distinguished from FINANCIAL STRUCTURE, which includes additional sources of capital such as short-term debt, accounts payable, and other liabilities.<sup>19</sup>

**FINANCIAL STRUCTURE** makeup of the right-hand side of a company's BALANCE SHEET, which includes all the ways its assets are financed, such as trade accounts payable and short-term borrowings as well as long-term debt and ownership equity. Financial structure is distinguished from CAPITAL STRUCTURE, which includes only long-term debt and equity.<sup>20</sup>

It is also important to note that neither accumulated depreciation or accumulated deferred income taxes are included in capital structure. Some appraisers have mistakenly included accumulated deferred income taxes in constructing a firm's capital structure. This is simply wrong for estimating the cost of capital and for appraisal purposes. The following quotation from *Financial Management* addresses this issue quite well:

Since depreciation-generated funds have the same cost as the firm's WACC when retained earnings are used for the equity component, it is not necessary to consider them when estimating the WACC...Therefore, deferred taxes, like depreciation, have a cost equal to the firm's WACC using retained earnings as the equity component. Indeed, deferred taxes arise solely because a firm records a different depreciation expense on its tax books than on the books used to report income to shareholders... Deferred taxes are treated the same way as depreciation cash flows: they are not included when estimating the firm's WACC...<sup>21</sup>

<sup>&</sup>lt;sup>19</sup> John Downes and Jordan Elliot Goodman, *Dictionary of Finance and Investment Terms*, (New York: Barron's, 1985), 54.

<sup>&</sup>lt;sup>20</sup> *Ibid.*, 132.

 $<sup>^{21}</sup>$  Eugene F. Brigham and Louis C. Gapenski, *Financial Management*,  $7^{\rm th}$  ed. (New York: The Dryden Press, 1994), 368-369.

The appropriate capital structure for use in estimating the INGPI's cost of capital is the expected capital structure that a typical purchaser would likely use to finance the purchase of the operating assets of a company within this industry. This typical purchaser would take into account the regulatory agency's allowed rate of return in analyzing the risk profile and selecting the market capital structure. Thus, an analysis of the typical market capital structure used in the interstate natural gas pipeline industry is appropriate. The market capital structure developed for the INGPI was calculated from information obtained from Value Line Investment Survey data base (Value Line) and Standard & Poor's Compustat data base as of January 2005. The capital structure study involved the following companies we believe to be representative of the interstate natural gas transmission pipeline industry: 36 companies classified by *Value Line* as the natural gas (diversified) industry (from the Value Line full data base), using both Value Line and S&P data; 25 companies from that group excluding the limited partnerships; 15 large companies from that group that have reported annual sales of at least \$750 million; and five (5) companies heavily involved with natural gas pipelines from the interstate natural gas pipeline forum group, which have traded common stock listed by Standard and Poor's. The results indicate that the market capital structure for the industry is approximately 25% debt, essentially no preferred stock, and 75% equity. For each of the above mentioned groups of companies, we calculated the simple average and median capital structure for each grouping using data reported both by Value Line and Standard & Poor's. As many traditional interstate natural gas pipelines have become subsidiaries of other pipelines and other energy companies, there are now less members of the interstate natural gas pipeline forum group, which have traded common stock. Thus, we are inclined to give a little less consideration to the data from the forum group only. Additionally, some of the companies (such as Dynegy, El Paso, and Williams) are much more leveraged currently due to financial problems primarily related to non-pipeline activities.

For purposes of analysis we used the market capital structure for each company. The market value of the common equity portion of the capital structure was determined by multiplying the number of shares outstanding times the recent price reported by *Value Line* and/or *Standard & Poor's*. As surrogates for the market value of debt and preferred stock we substituted the book value of each. The market values of both debt and equity are always preferred, if available. Since the book value of debt is usually close to market value, book value is usually used for the debt weight. This is not true of equity.<sup>22</sup> Only a few companies in this industry have issued preferred stock and, like debt, we used book value as a surrogate for the market value of preferred stock. Our recent analysis indicates that book values for long-term debt and preferred stock are fairly reasonable approximations for market value at the present

<sup>&</sup>lt;sup>22</sup> SBBI (Stocks, Bonds, Bills and Inflation), 2003 Yearbook: Valuation Edition, (Chicago: Ibbotson Associates, 2003), 14.

time, thus book value can be substituted as a reasonable proxy for the market value of debt and preferred stock capital.

The capital structure calculations can be found on the following four pages. As can be observed from the capital structure calculations using the natural gas transmission pipeline industry groupings described above, the indicators point to an approximate market capital structure of 25% debt (*D*) and 75% equity (*E*). (*Preferred stock was judged not to be of significant importance in the financing of companies in the overall interstate natural gas pipeline industry*.) We gave the most consideration to the median indicators (median figures being less influenced by extremes than averages) from the data groups made up of the Value Line Natural Gas Diversified Industry (All), the 25 companies from that group excluding the limited partnerships, and the Value Line Natural Gas Diversified Industry (Large<sup>23</sup>). We gave less consideration to the average figures in this particular calculation because the parent company information (notably Dynegy, El Paso Corp and Williams Companies) have changed dramatically due to heavy losses from energy trading. This same reasoning applies to the small group known as the Interstate Natural Gas Pipeline Forum Group, which is heavily influenced by a few companies with heavy energy trading losses.

On the following pages are the capital structure data from *Value Line* and *Standard & Poor's Compustat*.

<sup>&</sup>lt;sup>23</sup> Large pipeline group made up of companies with annual sales of over \$750 million.

### **Cost of Debt**

The expected return on debt, or the cost of debt capital ( $D_r$ ), is the rate that investors would incur when financing the purchase of the operating assets of an interstate natural gas pipeline company. It is the cost of debt that is appropriate for the cost of capital study and it is relatively simple to estimate. Unlike the cost of equity, the required return on debt is directly observable in the market. It is best approximated by the current yield-to-maturity (yield) on the applicable debt. The YTM (yield to maturity) is the rate of return the existing bondholders expect to receive, and it is also a good estimate of  $k_d$  (cost of debt), the rate of return that new bondholders would require.<sup>24</sup> Often an average of recent yields is also used. The yield exemplifies the market's expectation of future returns. If the market's expectations of future debt returns were different from those implicit in the price, the market price of the debt would be bid up or down so that the market's expectations were reflected in the price.<sup>25</sup>

From information in *Mergent Bond Record* (January 2005), we found the Moody's bond rating to be approximately **Baa3** and the *Standard & Poor's* long-term senior debt rating to be **BBB-** for the typical interstate natural gas pipeline. This rating is one level above junk status for bond ratings. The yield for utility bonds rated Baa was **6.10%** as of December 31, 2004 and the yield for corporate bonds rated Baa was **6.15%** as of December 31, 2004. Further, we took note of the yield to maturity for the *Value Line* Natural Gas Diversified Industry (All) group. Within this group we found the average and median yields to maturity for all the bonds with 20 or more years till maturity to be **6.30%** and **6.36%** respectively for the bonds rated **Baa**. Additionally, we found the median yield to maturity for all bonds issued by this group, regardless of rating, to be **6.65%**. From this information we determined the appropriate cost of debt capital to be **6.15%**. The following tables were used to illustrate the long-term debt ratings for the *Value Line* Natural Gas Industry and yield to maturity (YTM) for public utility bonds and corporate bonds as reported in *Mergent Bond Record*.

# **Cost of Equity**

In estimating the cost of equity capital, several methods are employed. The market cost of equity is often considered to be the most difficult part of computing the cost of capital because it relies on interpretation of projections by market analysts as well as the projections of the equity models used by the appraiser. The market cost of equity capital is equal to the rate of return *expected* by investors at their perceived level of risk for a company's equity. There are several methods used to estimate the cost of equity capital. The most common methods are the Gordon growth model sometimes referred to as the discounted cash flow method (or DCF method), the risk premium method (RP), and the capital asset pricing model (CAPM).

All estimates of the cost of equity rates fall into one of two classes. They are either (1) add-ons to an interest rate, or (2) ratios of return to investment. Add-on estimates of the cost of equity capital include RP and the CAPM. The DCF method is a ratio of return to investment.

After computing the cost of equity by the DCF, RP, and CAPM methods, the data was analyzed and reconciled to obtain the cost of equity capital before flotation costs of 11.30%. On the following page is a summary of the cost of equity calculations by each of the methods employed. The summary page is followed by an explanation of each method and the indicators found therein.

# **Summary of Cost of Equity Calculations**

DCF Indicators - January 1, 2005

	Value Line Data		S&P (IBE	S) Data
Company Groups	Average	Median	Average	Median
Value Line Natural Gas (Diversified) - All	12.73	13.19	11.31	10.84
Value Line Natural Gas (Diversified) - All w/o LPs	12.01	12.04	10.10	9.26
Value Line Natural Gas (Diversified) - Large	11.89	12.04	10.53	9.33
Interstate Natural Gas Pipeline Forum (Pipes)	11.16	9.80	10.63	9.33
S&P Screened Comparables Group	16.26	14.33	10.05	8.57
Averages	12.81	12.28	10.52	9.47

The discounted cash flow method for above industry groups were calculated as follows:

Using Value Line data and Value Line earnings growth estimates and S&P's Compustat data with Institutional Brokers Estimate System (IBES) earnings growth.

## Risk Premium Indicators - January 1, 2005

### **General Risk Premium Indicators**

	Rates		
Indicators	Rf	Rp	Indicator
20-Year Treasury Bonds (ex post)	4.84	7.20	12.04
20-Year Treasury Bonds (ex ante)	4.84	8.28	13.12

### **Risk Premium Indicators by Groups**

	Risk Premium	
Indicators	Average Media	
Natural Gas Diversified Industry (All)	12.95	12.85

Long-Term Gov't Bonds (ex ante)	4.84	8.28	0.85	11.88	

CAPM Formula: Ke = Rf + B(Rp)

<sup>\*</sup> CAPM Indicator is based upon a *Value Line* beta of 0.85. Ibbotson & Associates, 2005 SBBI & Risk Premia over Time Report;, & Federal Reserve data January 3, 2005.

### **DCF Method**

The discounted cash flow method of estimating the cost of equity is based on the formula

shown in Figure 2. Our computations using the DCF method are based upon information from the *Standard and Poor's Compustat* database, *Institutional Brokers Estimate System* (IBES), and the *Value Line Investment Survey* database. We began our analysis by screening the Standard and Poor's database of approximately 9,800 companies for companies with risk equal to the risk of the typical interstate natural gas pipeline. As a measure of financial risk Standard and Poor's has placed a rating of **BBB-** on most of the long-term debt of companies comprising the

$$\mathbf{K_e} = \frac{\mathbf{D_1}}{\mathbf{P_0}} + \mathbf{g}$$

where

 $K_{o} = Cost \ of \ equity$ 

 $D_1$  = Expected Dividend in year 1

 $P_0$  = Current price of stock

g = Growth in dividends

Figure 2

natural gas pipeline industry. Our first screening process was to find all companies having a S&P senior debt rating of BB+ to BBB (the highest rated double B debt to the mid-level triple B debt). This screening will give us a list of companies that have long-term debt which is believed to be either equal in risk or slightly less risky than the typical interstate natural gas pipeline. (Many of these companies have double B rated debt.) This measure is indicative of financial risk for the companies.

Next we screened the surviving group of companies by the return on net plant investment (before taxes). This is a measure of business risk and measures the ability of a company to compete in the market and maintain its rate of return before income taxes. From this calculation we screened out all companies varying more than fifty percent from the average return of the interstate natural gas pipelines industry.

Next we screened the surviving group of companies by their asset turnover ratios. The asset turnover ratio is found by dividing a company's total sales by its total assets. This ratio is indicative of the business risk faced by a company. It can be used to determine how competitive the company is within its industry and also how much capital must be invested to gain a dollar of sales. Thus, this ratio helps indicate the level of investment a competitor must invest to generate a competitive sales volume. Again, we excluded all companies which varied more than fifty percent from the average asset turnover ratio of the interstate natural gas pipelines industry.

Next we screened the surviving group of companies by their S&P adjusted betas. Beta is a measurement of the sensitivity of a company's stock price to the overall fluctuation in the Standard & Poor's 500 (S&P 500) Index Price. For example, a beta of 1.5 indicates that a company's stock price tends to rise (or fall) 1.5%, with a 1% rise (or fall) in the index price. The S&P adjusted beta of the interstate natural gas pipeline industry averages approximately 0.88 presently. Thus we

excluded all companies with S&P adjusted betas less than 0.73 and greater than 1.03. In our judgment, this range is a reasonable range of betas to use for comparison purposes in determining comparables of approximate risk to the natural gas pipelines. A table of risk screening data is shown below.

Pipeline Risk Screening Data - January 1, 2005 Value Line Natural Gas Diversified Industry (Large) S&P Data

	-	S&P Debt	S&P Debt			Asset

	Average	BBB-	12	0.88	11.98	0.51

Source: S&P Compustat, January 2005.

Surviving the screening process are twenty (20) companies, which in general should be approximately of equal or slightly less risk when compared to the interstate natural gas pipeline industry. These companies are:

AT&T Corp	NiSource Inc
CenterPoint Energy	Noble Energy
Cleco Corp	Norfolk Southern
CSX Corp	Pioneer Natural Resources
Devon Energy	PNM Resources
Duke Energy	PPL Corp
Great Plains Energy	Rayonier Inc
Hilton Hotels	Weyerhaeuser Co
International Paper	Xcel Energy Inc
Kerr-McGee Corp	XTO Energy

In addition to performing a DCF analysis for the companies listed above of approximately equal or slightly less risk to the interstate natural gas pipelines, we performed additional DCF analyses on four (4) other groups of companies, the Value Line natural gas (diversified) group (all companies), the Value Line natural gas (diversified) group (all companies excluding the limited partnerships), the Value Line natural gas (diversified) group (large companies – with over \$750 million in annual sales), and the interstate natural gas pipeline forum group (traded) that are heavily involved with pipelines. We used financial data from two independent sources, Standard and Poor's Compustat database, and the Value Line Investment Survey. The two independent sources of data gave us two sets of growth estimates for all five groups of companies. The growth estimates considered were provided by Value Line and the Institutional Brokers Estimate System (IBES) through the Standard and Poor's Compustat database. From these analysts' projections we calculated DCF indicators on all groupings and calculated a simple average and median indicator. We gave the most weight to the median indicator in each grouping. The median indicator is not affected by extreme values and outliers and thus is a very good indicator of central tendency of a representative sample of companies. We placed the most confidence in the estimates provided by the IBES projections, because these estimates were provided by a large group of financial analysts who monitor these companies.<sup>26</sup> It is our opinion, based on this documented data, that the appropriate cost of equity for the interstate natural gas pipeline industry by the DCF method is 11.25% as of January 1, 2005. The result of all of the DCF analysis and research can be found below.

# **Summary of DCF Method Indicators**

	Value Line Data		S&P (IB	ES) Data
Company Groups	Average	Median	Average	Median
Value Line Natural Gas (Diversified) - All	12.73	13.19	11.31	10.84
Value Line Natural Gas (Diversified) - All w/o LPs	12.01	12.04	10.10	9.26
Value Line Natural Gas (Diversified) - Large	11.89	12.04	10.53	9.33
Interstate Natural Gas Pipeline Forum (Pipes)	11.16	9.80	10.63	9.33
S&P Screened Comparables Group	16.26	14.33	10.05	8.57
Averages	12.81	12.28	10.52	9.47

The discounted cash flow method for above industry groups were calculated as follows: Using *Value Line* data and *Value Line* earnings growth estimates and S&P's *Compustat* data with Institutional Brokers Estimate System (IBES) earnings growth.

<sup>&</sup>lt;sup>26</sup> The Institutional Brokers Estimate System (IBES) is a database provided through *Standard & Poor's Compustat* of earnings expectations obtained from more than 3,500 security analysts from over 300 contributing firms.

#### **Risk Premium Method**

The risk premium method is a standard method of estimating the cost of equity  $(K_e)$  based on the formula in Figure 3. This method sums two elements of risk — a risk free rate, which is the price of time (the reward for deferring consumption and for not exposing funds to risk), and a risk premium, which is the additional reward for assuming risk. The nominal risk free rate includes the real risk free rate and an inflation premium. The risk premium includes an interest rate

$$\mathbf{K_e} = \mathbf{R_f} + \mathbf{R_p}$$
where

 $K_e = Cost \ of \ equity$ 
 $R_f = Risk \ free \ rate$ 
 $R_n = Risk \ premium$ 

Figure 3

risk, business risk, financial risk, and liquidity risk. All of these elements are included when calculating equity cost by the risk premium method.

Our risk premium calculations included computations for two categories of risk premium indicators — general indicators and indicators for the Value Line Natural Gas Diversified (all) group, the Value Line Natural Gas Diversified (large) group, and Interstate Natural Gas Pipeline Forum (Pipes) group. Our ex post risk premiums were derived from the 2005 Valuation Edition of Stocks, Bonds, Bills and Inflation (SBBI), published by Ibbotson Associates. Our ex ante risk premium was derived from the market-weighted expected cost of capital for the S&P 500 less the current 20-year Treasury bond rate. Our relevant current 'safe rates' for the general indicators were derived from the sources footnoted below.<sup>27</sup> The 'safe rates' (or base rates) used for each company within the company groupings were the average yields to maturity for the long-term debt (20+ years to maturity) of each company quoted in Mergent Bond Record (January, 2005). The average yield to maturity for each company's bonds was added to the SBBI corporate bond risk premium of 6.2% to obtain an individual estimate for each company in the group. Thus, the risk premium indicators for the individual groups are specific for each company within the group and, thus, as individualized as possible for each company.

The general Risk Premium (or equity build-up method) indicators, using the risk premium from *SBBI* published by Ibbotson Associates, Inc., indicates a cost of equity capital of 12.04% (ex post) and 13.12% (ex ante).

The range for all calculations of averages and medians of risk premiums using the indicators by specific company groups are between 12.27% and 13.78%. This measurement involved the use of the average and median long-term yields to maturity for company bonds with at least 20 years to maturity plus the corporate bond risk premium of 6.2%. A conservative view of these results would indicate a risk premium correlated indicator for the specific companies to

<sup>&</sup>lt;sup>27</sup> Ibbotson & Associates, 2005 SBBI & Risk Premia over Time Report: 2005 and The Federal Reserve, January 3, 2005.

be approximately 13.05%.

For the general indicators discussed above the ex post and ex ante indicators using the long-term government bonds is deemed appropriate because a purchase of an interstate natural gas pipeline company is considered a long-term commitment of capital, and thus the long-term bond risk premium should be indicative of the cost of long-term equity capital for the typical company. These indicators together would support a cost of equity of 12.75%.

The long-term bond risk premium indicators are well supported by the estimates derived from the specific indicators from the yields to maturity of all of the groups of interstate natural gas pipeline industry bonds with 20 years or more to maturity. We believe the appropriate cost of equity for the typical interstate natural gas pipeline by the risk premium method as of January 1, 2005 is **13.00%** as of January 1, 2005. This conclusion gives weight and consideration to all indicators. A summary of the cost of equity indicators by the risk premium method (or equity build-up method) is below and the supporting data begins on the following page.

### Risk Premium Indicators - January 1, 2005

#### **General Risk Premium Indicators**

	Rates		
Indicators	Rf	Rp	Indicator
20-Year Treasury Bonds (ex post indicator)	4.84	7.20	12.04
20-Year Treasury Bonds (ex ante indicator)	4.84	8.28	13.12

**Risk Premium Indicators by Groups** 

	Risk Premium	
Indicators	Average	Median
Natural Gas Diversified Industry (All)	12.95	12.85
Natural Gas Diversified Industry (Large)	13.11	13.13
Interstate Nat. Gas Pipeline Forum Group	13.78	13.78
Screened Comparables Group	12.57	12.27
Average	13.10	13.01

Risk Premium Formula: Ke = Rf + Rp

Base Rate: Yield to maturity on each company's long-term bonds, *Mergent Bond Record*, Jan. 2005. Risk Premium: SBBI, Ibbotson Associates, 2005 Corporate Bond RP of 6.2%.

## Table 1 Total Returns, Income Returns and Capital Appreciation

#### Summary Statistics of Annual Returns

From 1926 to 2004

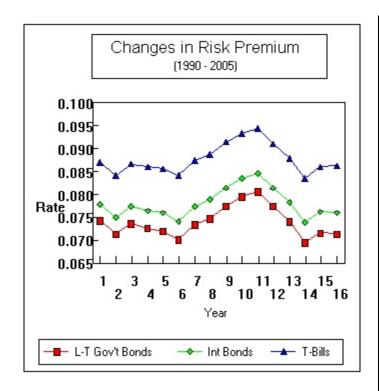

Series	Geometric Mean	Arithmetic	Standard Deviation
Large Company Stocks			
Total Returns	10.4	12.4	20.3
Income	4.3	4.3	1.5
Capital Appreciation	5.9	7.9	19.6

#### **Capital Asset Pricing Model**

The capital asset pricing model (CAPM) is a generally accepted method of estimating the cost of equity  $(K_e)$  based on the formula shown in Figure 4. It is the preferred method of

$$K_e = R_f + \beta R_p$$
where

 $K_e = Cost \text{ of equity}$ 
 $R_f = Risk \text{ free rate}$ 
 $\beta = Beta$ 
 $R_p = Risk \text{ premium}$ 
Figure 4

estimating the cost of equity by many analysts (it is recommended by Ibbotson Associates in their SBBI publication). The CAPM method is much like the risk premium method, however the risk premium is adjusted by beta before it is added to the appropriate risk level. The two elements of risk are a risk free rate, which is the price of time (the reward for postponing consumption and for not exposing funds to risk), and a risk premium, which is the additional compensation for assuming risk. The nominal risk free rate includes the real risk free rate and an inflation premium. The risk premium includes an interest rate risk, business risk, financial risk, and liquidity risk.

All of these elements are accounted for when we calculate the cost of equity using the CAPM method.

Our *ex post* CAPM calculations were based upon the long-term risk premium using the entire period data provided by Ibbotson Associates, which includes data from 1926 through 2004. The indicated cost of equity by this method was 10.96% at January 1, 2005. Our *ex ante* CAPM calculations were based upon the expected risk premium of 8.28% derived from the market-weighted average of the cost of equity capital less the current long-term Treasury bond rate. The indicated cost of equity by this method was 11.88% at January 1, 2005.

Our 'safe rates' for the CAPM calculations were derived as described in the risk premium method discussed earlier. Our beta estimate of 0.85 was based on observing the average, median, and market-weighted average betas from each of the groups. The average and median betas are shown in Figure 5. The calculated forward-looking (ex ante) CAPM indicator was found by deriving an expected risk premium

Group of Companies	Avg.	Med.
Value Line Betas VL Nat Gas (all)	0.88	0.80
VL Nat Gas (w/o LPs)	1.00	0.85
VL Nat Gas (large)	1.12	0.85
Nat Gas PL Forum (pipes)	1.34	0.85

Figure 5 - Value Line Betas

from the S&P 500 companies. The *ex ante* CAPM indicator is a good check on the reliability of the standard CAPM because it is forward looking. All prospective investment in interstate natural gas pipeline companies is based on an expectation of future benefits. This is consistent

with the fundamental principle underlying the income approach which is the principle of anticipation. In order to perform the *ex ante* CAPM indicator we derived the expected cost of equity for the companies making up the S&P 500 (which are expected to pay dividends). We developed the weighted average cost of capital (weighted by market value) for the S&P 500, which was 13.12%. We then subtracted the current long-term Treasury bond rate of 4.84% to obtain the expected equity risk premium of 8.28%. The market-weighted average is appropriate because the monthly fundamental beta is estimated based upon the sensitivity of a company's stock price to the overall fluctuation in the Standard & Poor's 500 (S&P 500) Index Price (with the S&P 500 being the surrogate for the market in general). The market-weighted average gives most weight to the highest market value stocks and is a very good indicator of the central tendency of the overall market cost of capital.

The general CAPM indicator, using the risk premium from *SBBI* published by Ibbotson Associates, Inc. and the pipeline industry beta of 0.85, indicates a cost of equity capital of 10.96%. To help determine the reasonableness of the general historical or *ex post* indicator we also computed an *ex ante* or forward-looking CAPM indicator. The ex ante CAPM indication of the cost of equity was 11.88%.

Based upon the analysis presented and considering all the relevant facts we believe the appropriate cost of equity capital indicated by the CAPM method is **11.25%** as of January 1, 2005. This conclusion gives weight and consideration to both indicators. A summary of the CAPM indicators and the supporting data begins on the following page.

### **Summary of CAPM Indicators - January 1, 2005**

		Rates		
Item	Rf	Rp	Beta	Indicator
CAPM Indicator *				
Long-Term Gov't Bonds (ex post)	4.84	7.20	0.85	10.96
Long-Term Gov't Bonds (ex ante)	4.84	8.28	0.85	11.88

CAPM Formula: Ke = Rf + B(Rp)

Correlation of the ex post and ex ante CAPM indicators using long-term government bonds as the 'safe rate' indicates a cost of equity of 11.50% for the Interstate Natural Gas Pipelines as of January 1, 2005.

Beginning on the following page are the *Value Line* betas for the various companies in the Natural Gas Diversified Industry (all), Natural Gas Diversified Industry (all without limited partnerships), the Natural Gas Diversified Industry (large), and the Interstate Natural Gas Pipeline Forum (Pipes) groups. Shown after the betas for the various groups are the calculations for the ex ante CAPM with supporting data from *Standard & Poor's Compustat*.

<sup>\*</sup> CAPM Indicator is based upon a *Value Line* beta of 0.85. Ibbotson & Associates, 2005 SBBI & Risk Premia over Time Report;, & Federal Reserve data January 3, 2005.

## Cost of Equity Indication Using Expected Risk Premium Weighted Average Cost of Equity for S&P 500 = Market Required Cost of Equity

#### **CAPM Calculations:**

S&P 500 Expected Equity Cost (Wt. Avg)	13.12		LT Gov't.		Cost of Equity by
Current Yield on L-T Gov't. Bonds	4.84	_	Bond Yield		CAPM
Expected Equity Risk Premium	8.28	_			
Beta	0.85	_			
Adjusted Risk Premium	7.04	Plus	4.84	Equals	11.88

Note: Forward-looking CAPM (Ex Ante) uses the weighted average expected return on the S&P 500 as the expected market return. The current US Government bond yield is deducted from the weighted average expected return to obtain the expected risk premium. The current beta is applied to the expected risk premium and the result is added to the current US Government bond yield to obtain the indicated cost of equity by the CAPM method.

(Calculations for expected market return for S&P 500 can be found on the following pages.)

#### Flotation Cost Adjustment

Flotation costs are the costs associated with issuing debt and equity. They are made up of several types of costs including underwriter's fees, legal expenses, cost of preparing the prospectus, etc. Flotation costs can be accounted for either by amortizing the cost (reducing the cash flow to discount), or by including them in the cost of capital. Many studies have been made regarding the amount of flotation costs for debt and equity capital.<sup>28</sup>

In general, the adjustment for flotation costs is a refinement of the basic unadjusted cost. In other words, usually the adjusted and unadjusted costs will not be very different. However, this doesn't imply that you shouldn't make the adjustment. The information needed to make the adjustment is readily available, and the adjustment itself doesn't require much effort or computer processing time. To paraphrase the film maker, Spike Lee, you should do the right thing (especially if the right thing is relatively easy to do).<sup>29</sup>

An adjustment for flotation cost must be made even if the issuing company has no plans to ever issue any additional securities. The following illustration is quoted by Roger A. Morin, PhD, *Regulatory Finance: Utilities' Cost of Capital*, (Arlington, VA: Public Utilities Reports, Inc., 1994), p. 170.] and fully addresses this issue.

Brigham, Aberwald, and Gapenski (1985) performed an excellent analysis regarding the need for a flotation cost adjustment. The following illustration adapted from Brigham, Aberwald, and Gapenski (1985) shows that: (1) even if no further stock issues are contemplated, the flotation adjustment is still permanently required to keep shareholders whole, and (2) flotation costs are only recovered if the rate of return is applied to total equity, including retained earnings, in all future years, even if no future financing is contemplated....<u>It is noteworthy that the adjustment is always required each and every year, whether or not new stock issues are sold in the future, and that the allowed return on equity must be earned on total equity, including retained earnings, for investors to earn the cost of equity.<sup>30</sup></u>

<sup>&</sup>lt;sup>28</sup> See Brigham and Gapenski, *Financial Management Theory and Practice*, 7<sup>th</sup> ed., (Dryden Press: New York), 869., Richard H. Pettway, "A Note on the Flotation Costs of New Equity Capital Issues of Electric Companies," *Public Utilities Fortnightly*, March 18, 1982, and Jay R. Ritter, "The Costs of Going Public," *Journal of Financial Economics*, December 1987.

2005 INGPI Cost of Capital - Page 62

Companies generally hire an investment banker to assist them when they issue common stock, preferred stock, or bonds. In return for a fee, the investment banker helps the company with the terms, price, and sale of the issue. The banker's fees are often referred to as **flotation costs**. The total cost of capital should include not only the required return paid to investors but also the flotation fees paid to the investment banker for marketing the issue.<sup>31</sup> [This identical quote is also found in *Fundamentals of Financial Management*, 9<sup>th</sup> ed. (Dryden Press) by Eugene F. Brigham and Joel F. Houston, Chapter 10.]

Additionally, Dr. Roger Ibbotson refers to flotation cost in his book, Stocks, Bonds, Bills and Inflation, when he discusses the cost of capital. He states the following:

Although the cost of capital estimation techniques set forth later in this book are applicable to rate setting, certain adjustments may be necessary. One such adjustment is for flotation costs (amounts that must be paid to underwriters by the issuer to attract and retain capital).<sup>32</sup>

All of these studies reach the conclusion that a flotation cost adjustment must be made when estimating the cost of capital. Alternatively, some finance textbooks suggest that it is better to adjust the net present value of the assets downward.

*Issue costs*. If accepting the project forces the firm to issue securities, then the present value of issue costs should be subtracted from base-case NPV.<sup>33</sup>

In either case (whether the cost of capital is adjusted upward or the net present value of the assets is adjusted downward) the end result is exactly the same – the market value of the assets subject to appraisal is lower as a result of flotation costs.

The flotation costs associated with debt for large issues conservatively are approximately 1%. For relatively large issues of equity, the flotation costs range from a low of 2% to as much as 6%.

From information derived from *Public Utility Finance Tracker* we determined the average flotation cost associated with the issuance of long-term debt and common stock of

<sup>&</sup>lt;sup>31</sup> Brigham, Eugene F. and Michael C. Ehrhardt, *Financial Management: Theory and Practice*, 10<sup>th</sup> ed. (Thomson Learning, Inc.: Stamford, CT, 2002), p. 452.

<sup>&</sup>lt;sup>32</sup> Stocks, Bonds, Bills and Inflation: 1999 Yearbook, Valuation Edition (Chicago: Ibbotson & Associates, Inc., 1999), p. 34.

<sup>&</sup>lt;sup>33</sup> Brealey, Richard & Stewart C. Myers, *Principles of Corporate Finance*, 7<sup>th</sup> ed. (New York: McGraw-Hill, 2002), p. 552.

natural gas and natural gas transmission companies. We found the average issuance cost of long-term debt to be 0.96% and the average issuance cost of common equity to be 4.31%. We selected 1.00% and 4.25% to be representative of the typical flotation cost associated with the issuance of long-term debt and common stock securities respectively.

On the following pages are the schedules detailing the long-term debt and common stock flotation costs.

Incorporating the flotation costs found on the previous pages into our cost of capital study is accomplished as shown in the table below.

Corp. Tax Rate = 38.00%			Flotation Cost Adjustment				
Capital	Portion	Cost	Product	Flot. Cost	Divisor	Adj Cost	Product
Debt	25.00%	6.15%	1.54%	1.00%	99.38%	6.19%	1.55%
Equity	75.00%	11.30%	8.48%	4.25%	95.75%	11.80%	8.85%
Totals	100.00%		10.02%				10.40%

The flotation cost adjustment for debt considers the tax deductibility of interest cost and the divisor for debt is obtained by subtracting the debt flotation cost times 1 minus the approximate corporate tax rate from 100% shown as follows:  $1 - (0.01 \times (1 - 0.38)) = 99.38\%$ . Next we divide cost of debt of 6.15% by the divisor to obtain the flotation cost adjusted cost of debt, which is then multiplied times the debt portion of the capital structure to obtain the product of 1.55%. The divisor for the equity cost is 1 minus the equity flotation costs (100% - 4.25% = 95.75%). Next we divide cost of equity of 11.30% by the divisor to obtain the flotation cost adjusted cost of equity, which is then multiplied times the equity portion of the capital structure to obtain the product of 8.85%. The sum of the two products is 10.40% and is the cost of capital for the typical interstate natural gas pipeline after accounting for flotation costs.

#### Other Issues Regarding the Cost of Capital

Some have suggested that a negative adjustment should be made to the cost of equity for survivorship bias. They argue that the United States has been the most successful stock market of the twentieth century and therefore equity costs do not consider the low returns that failing companies might indicate. If that is the case, is it possible that the equity risk premium statistics based only on U.S. data may overstate the returns of equities as a whole because they only focus on one successful market? According to Dr. Roger Ibbotson this is not the case.

While the survivorship bias evidence may be compelling on a worldwide basis, one can question its relevance to a purely U.S. analysis. If the entity being valued is a U.S. company, then the relevant data set should be the performance of equities in the U.S. market.<sup>34</sup>

Other studies have reached similar conclusions – that survivorship bias is of no significance in measuring the cost of equity in U. S. equity markets.

The U.S. equity premium plays an important role in many areas of finance research and practice. Therefore, the concerns raised by Brown, Goetzmann, and Ross (BGR) that the equity premium might contain serious survival bias should be studied with great care: If proven true, this hypothesis would have widespread impact.

Based on a general survival model developed in this paper, we show that the fundamental difficulty facing the survival argument is that to have high survival bias, the probability of market survival over the long run has to be extremely small, which seems to be inconsistent with existing historical evidence. Therefore, we argue that contrary to what BGR suggest, the survival bias in the U.S. equity premium is unlikely to be significant and the resultant concerns about the survival problem in the current literature are probably overstated.<sup>35</sup>

Thus, we believe that there is no significant survivorship bias affecting our estimate of the cost of capital for the Interstate Natural Gas Pipeline industry at January 1, 2005, and no adjustment is necessary.

### Supplement to the Cost of Capital Study

capitalized. The basic income formula is shown in the box to the

The income approach is based on the principle of anticipation primarily and involves converting dollars of expected future income into present value. The execution of the income approach involves the selection of the appropriate capitalization method, estimation of the expected income, and estimation of a  $Value = \frac{Income}{}$ proper capitalization rate which matches the income to be

Income-producing property is typically purchased for investment purposes, and the projected net income stream is the critical factor affecting its market value. An investor purchasing income-producing property is in effect trading a sum of present dollars for the right to a stream of future dollars. There is a relationship between the two, and the connecting link is the process of capitalization. Because future dollars are worth less than present dollars, the anticipated future dollars are discounted to a present worth on some basis that reflects the risk and the waiting time involved.

The historical development of the income approach reflects a movement away from an initial emphasis on physical components of value toward a greater emphasis on investment components. The initial division of capitalization was between the concept of value as income divided by a rate (straight capitalization) and as income multiplied by a factor (annuity capitalization). Contemporary income appraisal theory revolves around two categories of capitalization methods — *direct* capitalization and *yield* capitalization.

#### **Rates of Return**

right.

The typical investor's objective in any investment is to ultimately receive more than the amount invested. The investor thus wants a complete return of all capital invested and, in addition, a fair return on the capital invested. Thus, the investor expects to completely recoup his investment and be fairly compensated for the use of his capital. The return of capital is usually referred to as the recapture of the initial capital investment. The return on capital is usually referred to as the compensation an investor receives for the use of his capital until the capital is recaptured.

All rates of return can be classified as either 1) income rates or 2) yield rates. An example of an income rate is the *overall capitalization rate*  $(R_a)$ . An example of a yield rate is the property's *overall yield rate*, which is synonymous with the *discount rate* and the *cost of capital*. Under certain conditions, the income and yield rates for a property are equal even though they are not conceptually equal.

#### Categories of Capitalization

There are two categories (sometimes called methods) of capitalization which can be used in the income approach — *direct* and *yield* capitalization. Each category is based on sound appraisal theory and each is theoretically different in application. Direct capitalization is accomplished by the use of an *overall capitalization rate* ( $\mathbf{R}_{o}$ ). The overall capitalization rate is actually the percent that a single year's income (usually the first year's income) represents as compared to market value. Yield capitalization is accomplished through the use of an *overall yield rate* ( $\mathbf{Y}_{o}$ ). The overall yield rate is conceptually the weighted average of the interest rate for long-term debt and the equity yield rate and is also known as the *weighted average cost of capital* (*WACC*) or *discount rate* ®). Unlike the overall capitalization rate, the overall yield rate is not necessarily the percent of market value that the first year's income represents. However, under certain circumstances the overall capitalization rate and the overall yield rate are identical.

#### **Direct Capitalization**

Direct capitalization is a method of converting one year's income into value in one direct step, usually by dividing the income estimate by the appropriate income rate. It is the present worth of the future earnings that gives a proper indication of value by the income approach. Typically the income capitalized is the estimated net utility operating income expected in the following year. Net utility operating income for public utilities is defined as the income representing the amount available to pay the debt costs and equity costs for the property. Public utility regulatory commissions (both state and federal) recognize that net utility operating income is the level of income necessary to pay the cost of capital annually.

Regulatory commissions develop the cost of debt capital and cost of equity capital for the INGPI company in each rate case. The cost of debt capital and the cost of equity capital is weighted by the respective percentages of the amount of debt and equity in the overall capital structure for the utility. The resulting **weighted average cost of capital** is multiplied by the authorized rate base to obtain the authorized net utility operating income for regulatory purposes, which is the targeted amount that the regulatory commissions intend for the utility to earn each year to pay its cost of capital. Net utility operating income is reported on the utility's income statement and it is the amount available to pay to debt and equity holders. Thus, net utility operating income is the level of income set by regulatory commissions to fully cover the cost of capital of a public utility.

A note of caution about the use of direct capitalization is given here. There are six accepted techniques which can be used correctly to derive the overall capitalization rate used in direct capitalization. They are as stated below.

from effective gross income multipliers and net income ratios, 3) band of investment—mortgage and equity components, 4) band of investment—land and building components, 5) the debt coverage formula, and 6) yield capitalization techniques such as the general yield change formula,  $R_O$  = yield – change in income and value, and the Ellwood method.<sup>36</sup>

No generally accepted appraisal literature indicates that it is proper under any circumstances to use sales of stock as comparable sales for deriving an overall capitalization rate or even an equity capitalization rate. In fact, there is an abundance of caution in appraisal literature about the use of sales that are not comparable to the property being appraised (such as deriving earnings-price ratios from stock transactions). For example, the following quotation addresses this issue:

Fundamental Investment Difference between Investment Securities and Real Estate/Tangible Personal Property. Table 29-2 summarizes some of the intrinsic differences between capital market securities (whether debt or equity instruments) and real estate and tangible personal property (either individual assets or going concern assemblages of assets) as investment alternatives.

Table 29-2
Investment Differences between Securities and Real Estate/Personal Property

#### Securities (Debt or Equity Instruments) Real Estate/Personal Property (Individually or as a Mass Assemblage) 1. Liquid, marketable investments 1. Illiquid investments Noncontrolling interest in income Controlling interest in income production 2. production and distribution and distribution 3. Small, absolute dollar investment required 3. Large, absolute dollar investment 4. Small percentage of overall wealth required committed to this investment 4. Large percentage of overall wealth 5. Diversified portfolio of investments committed to this investment Short-term investment time horizon 5. Nondiversified portfolio of investments 6. Long-term investment time horizon 7. Does not require re-investment to maintain 6. investment base 7. Requires "replenishment" investment to 8. Investments expected to appreciate over maintain investment base 8. time Investments expected to depreciate over 9. Income typically subject to only individual time 9. tax (from investor's perspective) Income typically subject to both 10. Portfolios can be created in limitless corporate and individual tax (from combinations of risky securities and riskinvestor's perspective) free securities 10. Portfolio limited to the particular combination of real estate and personal property that operate the subject business

As the table indicates, there are fundamental investment risk and return differences between (1) marketable, minority interests in debt and equity securities and (2) nonmarketable, controlling interests in operating real estate and tangible personal property. Due to these differences, and for other reasons, it is unlikely that an economic

<sup>&</sup>lt;sup>36</sup> The Appraisal of Real Estate, 11<sup>th</sup> ed., (Chicago: Appraisal Institute, 1996), p. 514.

Copyright © 2005 by Tegarden & Associates, Inc. All rights reserved.

2005 INGPI Cost of Capital - Page 72

model that correlates nondiversified risk and expected return for one type of investment will effectively serve the same function for such a different type of investment.<sup>37</sup>

Thus, it is clear from appraisal literature that it is absolutely wrong to use earnings-price ratios derived from stock sales as the equity capitalization rate or the equity yield rate in the appraisal of tangible assets or mass assemblages of assets as a going concern. Further, it is improper to use earnings-price ratios to match with the net utility operating income authorized by the FERC. The FERC does not utilize earnings-price ratios in the determination of the cost of equity for any company or in setting the authorized net operating amount. Finally, for the FERC to set the cost of equity capital based on earnings-price ratios would violate the mandates of the US Supreme court in their *Hope Natural Gas* and *Bluefield Water Works* decisions, which require the regulatory commissions to allow the regulated utilities to earn their cost of capital (commensurate with the return earned by companies of comparable risk).

Appraisal texts do not tell us that an appraiser may derive equity capitalization rates from the stock market, however the same appraisal texts emphatically state that appraisers can derive equity yield rates from stocks and bonds of commensurate risk in the market. The use of earnings-price ratios as a substitute for the equity capitalization rate in deriving equity value, is simply not permissible. Additionally, the majority of public utility companies are subsidiaries of publicly traded holding companies. The use of a parent company traded stock earnings-price ratio as comparison to an untraded subsidiary company would further exacerbate an incorrect equity value.

#### **Yield Capitalization**

Yield capitalization is a method of converting a series of income flows (called cash flows) or a singular representative level cash flow into present value by discounting the expected future benefits at an appropriate discount rate (synonymous with the property's **overall yield rate** or **cost of capital**).

To perform yield capitalization, an appraiser 1) selects an appropriate holding period; 2) forecasts all future cash flows or cash flow patterns; 3) chooses an appropriate yield, or discount rate; and 4) converts future benefits into present value by discounting each annual future benefit or by developing an overall rate that reflects the income pattern, value change, and yield rate. The application of capitalization rates that reflect an appropriate yield rate, the use of present value factors, and discounted cash flow analysis are all yield capitalization

<sup>&</sup>lt;sup>37</sup> Pratt, Reilly, & Schweihs, *Valuing A Business*, 3<sup>rd</sup> edition, (Chicago: Irwin Professional Publishing, 1996), 708.

procedures.38

Thus, the appraiser performs yield capitalization by either 1) discounting each individual cash flow to its present value for the duration of the income, or 2) capitalizing the appropriate income at an overall capitalization rate, which represents the income pattern, value change, and yield rate.

Upon projecting the amount, timing, and duration of the cash flows to the property being appraised, the appraiser must identify the pattern that the cash flow is expected to follow during the holding period. Those patterns are either variable, level, increasing, or decreasing annuities. For a level annuity where a property is expected to generate a level net utility operating income for a finite period of time and then be resold at the original purchase price, the property can be valued with capitalization in perpetuity by dividing the periodic income by the appropriate discount rate. In this model the discount rate and the overall capitalization rate are the same.<sup>39</sup>

When the net income consists of a fixed amount that represents the return of capital (depreciation expense) plus a declining amount representing the return on the capital remaining in the investment, classic straight-line capitalization can be used to value the property.<sup>40</sup> In this model, as with the level perpetuity, the discount rate and the overall capitalization rate are equal when properly applied to a utility's net cash flow.

If the cash flow pattern is expected to be in the form of a variable annuity each individual income flow will be discounted into an indication of present worth at the appropriate discount rate for the holding period. Further, the appraiser discounts any remaining value in the investment at the end of the holding period and adds the total present worth of the variable cash flows to the present worth of the future value at the end of the holding period. The total represents the present worth of the total property.

The application of the DCF model for a variable annuity can be accomplished using the following formula.

Value = 
$$\frac{I_1}{(1+r)^1} + \frac{I_2}{(1+r)^2} + \frac{I_3}{(1+r)^3} + \dots + \frac{I_n}{(1+r)^n}$$

In this formula, I equals income or cash flow in periods 1 through n, and r equals the discount rate. Where income has the characteristics of a perpetuity or of a classic straight line

<sup>&</sup>lt;sup>38</sup> The Appraisal of Real Estate, 11<sup>th</sup> ed., (Chicago: Appraisal Institute, 1996), 529.

<sup>&</sup>lt;sup>39</sup> *Ibid.*, 537.

<sup>&</sup>lt;sup>40</sup> *Ibid.*, 540.

capitalization model, the universal capitalization formula,  $Value = Income \div Rate$ , can be used. In this case the overall capitalization rate will equal the discount rate.

To derive *equity yield rates* from market information, yield capitalization permits some things that would not be proper when using direct capitalization. For example, generally accepted appraisal texts record how it is permissible to use stocks and bonds for determination of equity yield rates in alternative investments when appraising real estate.

An investor may compare the expected equity yield on a real property investment with the yields on alternative investments with commensurate risk (e.g., stocks and bonds) and with a lender's yield on mortgages secured by similar real property.<sup>41</sup>

The Appraisal Institute goes on to state:

To estimate equity yield rates, appraisers must do market research. This research can take many forms and may include one or more of the following analyses...Comparison with the equity yield rates achieved in alternative investments of comparable risk such as stocks and bonds...<sup>42</sup>

An important difference between yield capitalization and direct capitalization is that in yield capitalization when deriving the equity yield rate, i.e., the cost of capital, it is entirely appropriate to use sales of stock (the capital asset pricing model, DCF or Gordon growth model, or risk premium models) to derive the equity yield rate. However, when using direct capitalization, it is absolutely inappropriate to use sales of stock (earnings-price ratios) to derive equity capitalization rates. The reason is simple; equity cap rates are intended to be ratios between income and value while equity yield rates are not. Thus, it is critical that the sales used in deriving those ratios be virtually identical to the property being appraised. Stocks, quite simply, are not comparable to tangible assets as discussed in the quotation on page 72. Because stock sales used to derive equity yield rates are used to indicate relative risk between investments, it is entirely appropriate to use stock sales to derive equity yield rates.

### **Estimation of Income to Capitalize**

The income level capitalized in the income approach is usually called *cash flow*. In fact, as mentioned previously on page 9, Dr. William Kinnard, MAI explains that all of the annual "income" figures used in appraising income-producing properties are *cash flows* rather than accrual accounting incomes. Cash flow can be defined in a number of ways, however for

<sup>&</sup>lt;sup>41</sup> *Ibid.*, 554.

<sup>&</sup>lt;sup>42</sup> *Ibid.*, 555.

appraisal purposes it generally consists of income necessary to satisfy the cost of capital plus depreciation expense. Commercial and general appraisers recognize this level of income as simply *net operating income*. Utility appraisers know that the definition of "net utility operating income" for public utilities and commercial properties is different in one important aspect. For public utilities the level of income reported as "net utility operating income" is only that income available to pay the utility's cost of capital, while for commercial properties "net operating income" includes not only the level of income available for debt and equity, but also the income to recapture a portion of the wasting asset (*otherwise known as depreciation expense*).

In general commercial appraisals cash flow is typically defined as simply net operating income (as defined for general commercial appraisal purposes), which is the income available for debt and equity and the depreciation expense. For an illustration of this type of analysis, refer to *The Appraisal of Real Estate*, 11<sup>th</sup> edition, page 564.

For public utility appraisal, cash flow is often defined as net utility operating income (defined as the income available to pay the cost of capital) plus depreciation expense and the current portion of deferred income taxes. This definition of cash flow is sometimes referred to as *gross cash flow* because there is no deduction for capital expenditures to keep the utility operating, Thus this cash flow model will have a limited life duration. In other words, gross cash flows cannot continue indefinitely without significant new investment to keep the utility operations ongoing.

Another variation of this same general definition of cash flow for a public utility is called *net cash flow*, which is the gross cash flow less capital expenditures. Some refer to this as gross revenue less all cash disbursements except interest expense. For the appraisal of public utilities where it is assumed that the amount of capital reinvestment is equal to the depreciation expense, *net cash flow* can be defined simply as utility net utility operating income. For the appraisal of a public utility as a going concern, net cash flow is usually the best level of income to work with. The purpose of this cost of capital study is to provide the cost of capital, which can be used to capitalize the net cash flow for the typical interstate natural gas pipeline company for the purpose of estimating market value.
